

From the Liar Paradox, we can see the limits of logic. In the proof of Gödel's theorem, substitution is the core. The metamathematical statement posed is "Substitution cannot be proven", but substitution itself is then brought into logical operations to produce the paradoxical proposition "Substitution = Substitution cannot be proven." This creates a circular loop, while its true meaning remains simply "Substitution cannot be proven."

Why does this paradox arise? Because the logical system used for the proof is itself incomplete. And as a result, it generates the paradox.

That is, with Gödel's theorem—"No system is complete"—the proof itself uses an incomplete logical system (a system that, as the theorem states, cannot be complete) to prove it, thereby creating a circular loop.

Thus, to summarize my writings, I propose the following propositions (truths of the supreme and unique cosmos):

1) The world is signal—a sequence of numbers following one another in an orderly way, from which arise the operating laws of the universe: from the fundamental forces and physical laws to bodies of knowledge such as biology, philosophy, astrology, the Five Elements, parallel universes, etc.

2) There exists a constant G (the smallest unit, the smallest distance), meaning there is no infinitely small but rather a stopping point.

3) If a logical system is incomplete (has limits), it will by itself generate paradoxes, such as propositions that are true but cannot be proven, or contradictions that cannot be resolved.

4) When a logical system is incomplete, there will naturally be something outside it. And as this incomplete logical system expands, it will encounter those points, moving toward a higher state of the system. This means that, given the current limitations of human knowledge (bounded by mathematics, logic, physics, etc.), there will be paradoxes that cannot be solved; but as humanity discovers more and opens new horizons, those paradoxes will gradually be resolved.

5) At some point, the incomplete logical system will expand (in reality, become seamlessly connected) into a complete system. This is the unique and supreme system—the state “Me.” In this state, the system is unique and supreme; there is nothing outside it. Here, there is no such thing as true or false of the system, and the truth or falsity of things within the system is determined solely by the system itself, without reference to anything beyond it—for nothing else exists. The word “beyond” here should not be misunderstood as acknowledging something outside the system; it is merely a limitation of language in this dimension, a way of distinguishing things within the system.

6) The supreme system has a self-correcting mechanism. Since everything in the system is decided by the system, if there is any deviation from the principles of operation set by the system, the system itself will adjust.

7) The supreme system has thought—it is the “being” who formulates and governs the principles of the system.

These propositions are the ultimate truths of the cosmos. They do not require proof, because they are established and operated by the supreme universe itself. Moreover, if one were to use the current foundations of human knowledge (which are incomplete) to attempt proof, it would not succeed (for example, propositions 6 and 7).

These are simply a few of my personal reflections that I wish to share from my own contemplations. Thank you for reading these lines.
