General dynamic equation of a multi-particle system of Spatial Arithmetic

Continuing from the previous article, spacetime is the spatial value distribution state of an energy system/unit, where space is the transformed spatial value and time is the untransformed spatial value, conforming to the Deterministic Equation of Reality:

$1 = SV/t^2 + (f/f_o)^2$

Each unit of energy obeys the Deterministic Equation, so we have the general equation of motion for a multi-particle system as follows:

$$SV_T/t^2 + (f_T/f_o)^2 = (SV_1/t^2 + (f_1/f_o)^2 + SV_2/t^2 + (f_2/f_o)^2 + \ldots + SV_n/t^2 + (f_n/f_o)^2)/n$$

Where: SV_T/t^2, $(f_T/f_o)^2$ is the spatial value distribution of the multi-particle system. SV_i/t^2, $(f_i/f_o)^2$ is the spatial value distribution of each energy unit.

When multi energy units combine to form a homogeneous system (particle shape), the energy units have the same phase, the same frequency, the same ratio of spatial value transformations, and the ratio of spatial value transformations in each energy unit is also the ratio of spatial value transformations in the system. The untransformed spatial value is the mass.

Thus, when energy is supplied to this homogeneous system (energy acting on the particle), it will change the ratio of spatial value transformations (frequency increases or decreases depending on how the energy acts on the phase), but the total untransformed spatial value remains constant to maintain the particle shape (particle ID). The ratio of spatial value transformations changes, but the total untransformed spatial value of the particle (ie. mass, particle ID) remains constant.

The fundamental forces of the universe (gravity, the strong force, the electroweak force (the four fundamental forces of the material world),...) are essentially frequency interactions (SV is the frequency spread out into space and f is the internal frequency that is compressed). These forces reflect the spread-out frequency and internal frequency interactions in phase at energy units / systems.

This is only a personal viewpoint that I would like to share from my own reflections. Thank you for reading these lines.
